## **Listing of All Claims Including Current Amendments**

- 1. (Cancelled)
- 2. (Currently amended) A method as claimed in claim 14, <del>characterized in that the elevated temperature</del> wherein the marking agent is <u>applied at a temperature</u> between 300°C and 600°C.
- 3. (Cancelled)
- 4. (Cancelled)
- 5. (Currently amended) A method as claimed in claim 14, characterized in that wherein the marking agent is applied to the surface of the container in the form of a bar code.
- 6. (Currently amended) A method as claimed in claim 5, characterized in that wherein said bar code is applied annularly onto a cylindrical portion of the sample container in a manner that said bar code is readable along a cylindrical axis of the sample container.
- 7. (Currently amended) A method as claimed in claim 14, <del>characterized in that</del> wherein the marking agent is applied to the surface of the container along with numerals or letters.
- 8. (Currently amended) A method as claimed in claim 14, <del>characterized in that</del> wherein the marking agent is applied to the surface of the container in the form of numerals or letters.
- 9. (Currently amended) A method as claimed in claim 14, <del>characterized in that</del> wherein the marking agent is applied to the surface of the container in the form of symbols.

- 10. (Cancelled)
- 11. (Currently amended) The method according to claim 14, further comprising the step of manufacturing a container for holding a sample to be analyzed wherein the marking agent is applied to the surface of the container at about 500 °C.
- 12. (Cancelled)
- 13. (Cancelled)
- 14. (Currently amended) A method for labeling a sample container, comprising the steps of:

elevating a temperature of the container to an elevated temperature; cooling the container and;

applying a marking agent to a surface of the container while cooling the container above a degassing temperature characteristic of the marking agent. A method for labeling a sample container, to provide an identification to a sample to be received therein, during a manufacturing process of the sample container, the sample container being usable for holding the sample within the container at an operating temperature higher than a room temperature, the method comprising:

producing a sample container in a heated environment;

cooling the heated sample container to a temperature interval between a maximum temperature occurring during the production of the sample container and the operating temperature of the sample to be received therein; and

applying a marking agent for identification of the sample to a surface of the sample container at the temperature interval such that volatile constituents of the marking agent are evaporated during the manufacturing process of the sample

container to prevent contamination of the sample to be received within the sample container and usable at the operating temperature.

- 15. (Currently amended) A method as claimed in claim 14, characterized in that wherein the marking agent is applied to the container by ink jet printing.
- 16. (Withdrawn) A method of labeling a sample container, the method comprising: applying a marking agent to a surface of the container; and evaporating volatile constituents of the marking agent.
- 17. (Withdrawn) The method as set forth in Claim 16 wherein evaporating volatile constituents of the marking agent comprises elevating the temperature of the container to an elevated temperature above a degassing temperature characteristic of the marking agent.
- 18. (Withdrawn) The method as set forth in Claim 17 wherein elevating the temperature of the container comprises elevating the temperature of the container to a temperature above a sample analysis temperature.
- 19. (Withdrawn) The method as set forth in Claim 16 wherein applying a marking agent to a surface of the container comprises applying a bar code to the surface of the container.
- 20. (Withdrawn) The method as set forth in Claim 16 wherein applying a marking agent to a surface of the container comprises applying numerals or letters to the surface of the container.
- 21. (Withdrawn) The method as set forth in Claim 16 wherein applying a marking agent to a surface of the container comprises applying symbols to the surface of the container.

Page 5 Serial No. 09/403,072 Response to Official Action

- 22. (Withdrawn) The method as set forth in Claim 16 wherein applying a marking agent to a surface of the container comprises applying an ink to the surface of the container.
- 23. (Withdrawn) The method as set forth in Claim 17 wherein in that the elevated temperature is between 300°C and 600°C.
- 24. (Withdrawn) The method as set forth in Claim 17 wherein in that the elevated temperature is approximately 500°C.
- 25. (Withdrawn) The method as set forth in Claim 17 further comprising cooling the container.
- 26. (Withdrawn) The method as set forth in Claim 25 further comprising applying a marking agent to a surface of the container while cooling the container.
